

Requirements

- Sketch.app
- Node.js (installed by the scripts below)
- Gulp (installed by the scripts below)
- This folder for each project

Installation

Open a terminal window, type each of these commands:

1. Install brew package manager (to easily install node & gulp):
`ruby -e "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/master/install)"`
2. Install node:
`brew install node`
3. Install gulp:
`brew install gulp`
4. Install sketch-tool:
`curl -L https://raw.githubusercontent.com/cognitom/dotfiles/master/lib/sketchtool.sh | sudo sh`
The last command will ask for your admin password, (which probably is the same as you have on os x login for your user)

First time init of your folder.

1. Unpack the zip, place the folder where you want to work, rename it if you like...
2. Open terminal, type `cd` and drop the downloaded folder on the terminal, press enter
3. Setup the node installation in your folder:
`npm install`

Usage

1. Open terminal, type `cd` and drop the downloaded folder on the terminal, press enter
2. Run gulp by typing `gulp`, press enter.
3. Work on and save either `app.js` or `assets.sketch` in the `src` folder.
